

# The role of large-scale photovoltaic energy storage power stations

How can energy storage help a large scale photovoltaic power plant?

Li-ion and flow batteries can also provide market oriented services. The best location of the storage should be considered and depends on the service. Energy storage can play an essential role in large scale photovoltaic power plants for complying with the current and future standards (grid codes) or for providing market oriented services.

Which technology should be used in a large scale photovoltaic power plant?

In addition, considering its medium cyclability requirement, the most recommended technologies would be the ones based on flow and Lithium-Ion batteries. The way to interconnect energy storage within the large scale photovoltaic power plant is an important feature that can affect the price of the overall system.

Can a large scale photovoltaic power plant interconnect energy storage?

The way to interconnect energy storage within the large scale photovoltaic power plant is an important feature that can affect the price of the overall system. This is a field still requiring further research.

Are energy storage services economically feasible for PV power plants?

Nonetheless, it was also estimated that in 2020 these services could be economically feasible for PV power plants. In contrast, in the energy storage value of each of these services (firming and time-shift) were studied for a 2.5 MW PV power plant with 4 MW and 3.4 MWh energy storage. In this case, the PV plant is part of a microgrid.

What are the energy storage requirements in photovoltaic power plants?

Energy storage requirements in photovoltaic power plants are reviewed. Li-ion and flywheel technologies are suitable for fulfilling the current grid codes. Supercapacitors will be preferred for providing future services. Li-ion and flow batteries can also provide market oriented services.

How a large scale PV power plant works?

As shown, large scale PV power plants have several generation units (generation unit = PV array + converter). But from the transmission system operator viewpoint, it is a single generator connected to the point of common coupling (PCC). Hence, the power delivered to the grid and the grid code fulfilment is checked at the PCC.
