

# Total wind power generation in 2030

How much wind energy will be produced by 2030?

The report examines the costs, major impacts, and challenges associated with producing 300 GW of wind generating capacity, which is equivalent to 20% wind energy, by 2030. The report's conclusions include:

How will solar PV & wind impact global electricity generation?

The share of solar PV and wind in global electricity generation is forecast to double to 25% in 2028 in our main case. This rapid expansion in the next five years will have implications for power systems worldwide.

How much wind power is installed in 2022?

Globally, 77.6 GW of new wind power capacity was connected to power grids in 2022, bringing total installed wind capacity to 906 GW, a growth of 9% compared with 2021. The world's top five markets for new installations in 2022 were: Altogether, they made up 71% of global installations last year, collectively 3.7% lower than 2021.

How much renewable power will the world have by 2030?

Between now and 2030, the world is on course to add more than 5 500 gigawatts of renewable power capacity - roughly equal the current power capacity of China, the European Union, India and the United States combined. By 2030, we expect renewables to be meeting half of global electricity demand."

How much wind power will Europe install in 2024-2030?

The volume of new offshore installations is growing - last year it was a record 3.8 GW in Europe. But 2/3rds of the new wind installations up to 2030 will continue to be onshore. We expect Europe to install 260 GW of new wind power capacity over 2024-2030. The EU-27 should install 200 GW of this - 29 GW a year on average.

How much wind power does the world need?

The world's installed wind power capacity now meets around 10% of global electricity demand - another important milestone. More than ten countries now have a wind power share of more than 20%, led by Denmark, which generates an astonishing 56% of its electricity from wind.

Denmark's deployment targets are impressive: by 2030, onshore wind and solar power generation are to quadruple. Offshore wind capacity is targeted to increase potentially sevenfold to 18 gigawatts (GW) by 2030 and 35 GW by 2050, from ...

China added almost twice as much utility-scale solar and wind power capacity in 2023 than in any other year. By the first quarter of 2024, China's total utility-scale solar and ...

In 2023, an estimated 96% of newly installed, utility-scale solar PV and onshore wind capacity had lower

# Total wind power generation in 2030

generation costs than new coal and natural gas plants. In addition, three-quarters of new wind and solar PV plants offered cheaper ...

And despite ongoing challenges, the wind sector is also poised for a recovery, with the rate of expansion doubling between 2024 and 2030, compared with the period between 2017 and 2023. Already, wind and solar ...

Wind energy's share of total utility-scale electricity- generation capacity in the United States grew from 0.2% in 1990 to about 12% in 2023, and its share of total annual ...

Total electricity generation from wind in the EU was 466 TWh, up from 412 TWh in 2022. 2030 target within reach Today's report includes an outlook for new wind installations over the period 2024-30, based on the ...

Taking into account all facets of wind energy (land-based, offshore, distributed), the new Wind Vision Report defines the societal, environmental, and economic benefits of wind power in a scenario with wind energy supplying 10% of the ...

By 2030, renewables will collectively surpass natural gas to be the predominant source of generation in the United States. Solar electric generation (which includes photovoltaic (PV) and thermal technologies and ...

By the end of this decade, the share of wind and solar PV alone in global electricity generation is set to double to 30%, according to the forecast. However, the report emphasises the need for governments to ramp up their ...

Total electricity generation from wind in the EU was 466 TWh, up from 412 TWh in 2022. 2030 target within reach. Today's report includes an outlook for new wind installations over the period 2024-30, based on the ...

Europe installed 18.3 GW of new wind power capacity in 2023. The EU-27 installed 16.2 GW of this, a record amount but only half of what it should be building to meet its 2030 climate and energy targets. 79% of the ...
