What is a rotor inlet temperature?

Also known as Rotor Inlet Temperature (RIT), the firing temperature is arguably the most important gas turbine parameter (even more so than TIT) because it quantifies the true work generation ability of the cycle working fluid.

What is a generator rotor?

The generator rotor represents an excellent combination of electrical, mechanical and manufacturing skills in which the field coils are well insulated, supported and ventilated in a compound structure rotating at very high speed (typically 1800 or 3600 rpm).

What are the components of a generator rotor?

The size and life of generator rotors are temperature, mechanical force and electrical insulation. typical generator field. Note the major components: rework or modifications is also discussed. This There are, of course, variations on this configuration. For example, while the illustrated design uses radial fans, other designs use axial fans.

Can a direct cooled rotor uprate a gas turbine?

The same applies to a direct-cooled conversion or a replacement rotor with perhaps more uprate capability. It has been common to support a gas turbine or steam turbine uprate by taking advantage of the existing generator margin (i.e., just operate the generator at a higher power factor than originally designed).

What factors affect a generator rotor?

There are a number of other concerns that also affect generator rotors. Thermal sensitivity is the term used to describe an excessive vibration of the generator rotor, induced by the heating effect of the field current. As field current flows in the winding, the copper heats up. Two things happen as a consequence:

What causes a generator rotor to degrade?

One component of the generator that is typically refurbished, upgraded or uprated is the generator rotor (field). Degradation of the generator field can be caused by a number of factors, including a breakdown in insulation due to time and temperature and mechanical wear.

That would result in a manifold pressure, temperature and density of 83.7 "hg, 126 °F, and 0.196 lbm/ft<sup>3</sup>; respectively, for a system density ratio of 2.77 and an inlet air ...
