What is the average wind speed of a land-based wind site?

For land-based wind, each of the potential wind sites represented in the ReEDS model is associated with 1 of 10 wind speed classes. Annual mean wind speeds, averaged for all years from 2007 through 2013, range from 1.72 to 12.89 meters per second (m/s).

What is land-based wind energy?

One of the most mature and widely deployed forms of renewable energy, land-based wind energy refers to electricity generated by wind turbines installed on land by companies.

What percentage of US electricity is generated by wind?

Wind comprises a significant share of electricity supply. U.S. wind power deployment was relatively low in 2023, totaling 6.5 gigawatts (GW) and representing \$10.8 billion in investment. Yet wind energy contributed 10% of the nation's electricity supply, and as much as 37% in the Southwest Power Pool.

What is the market value of land-based wind?

Land-Based Wind Market Report 55 The grid-system market value of wind rebounded in 2021 to levels last seen in 2018, and is roughly consistent with recent PPA prices of under \$20/MWh to \$40/MWh. In many regions of the country, wind projects participate in organized wholesale electricity markets.

Which states have the most wind energy?

In addition, four states (Iowa, South Dakota, Kansas, and Oklahoma) exceeded 40% wind energy penetration. Global land-based wind additions reached a record 117 GW in 2023, yielding a cumulative 1,021 GW. The United States remains the second-leading market in terms of annual capacity additions and total cumulative capacity.
