Can you walk on solar panels?

In short, yes. However, while walking on solar panels is possible and safe for you and the panels, it is not always recommended. To help you understand more about it, in this article, we explain how resistant solar panels are, how to walk on top of a solar panel properly, and what will happen if you do it the wrong way.

How does the photovoltaic effect occur?

The photovoltaic effect occurs when photons from the sun's rays hit the semiconductive material (typically silicon) in the cell of the solar module. The photons activate electrons, causing them to free themselves from the semiconductive material. Photons hit the solar panel causing electrons to be freed during the photovoltaic effect.

How do solar photovoltaic cells work?

Solar photovoltaic cells are grouped in panels, and panels can be grouped into arrays of different sizes to power water pumps, power individual homes, or provide utility-scale electricity generation. Source: National Renewable Energy Laboratory (copyrighted)

What happens if you walk on solar panels?

Walking on panels leads to cracks and breakage. Also, the thin-film panels cannot handle heavy weight. When you walk on the solar panel glass, they get scratched easily from the particles stuck to your foot or footwear. When scratches on the glass, it loses its optimum ability to utilize the sunlight, leading to a lowered solar cell efficiency.

What causes a solar panel to deteriorate?

Apart from walking on solar panels, hail can cause micro-cracks that gradually deteriorate the panel. Similarly, snow causes a change in thermal conditions leading to degraded panel functionality. Storm and lightning are also natural causes that damage the panel.

What is a photovoltaic (PV) cell?

A photovoltaic (PV) cell, commonly called a solar cell, is a nonmechanical device that converts sunlight directly into electricity. Some PV cells can convert artificial light into electricity. Sunlight is composed of photons, or particles of solar energy.
