

Wind power blade grinding

How to calibrate wind turbine blades?

Hu et al. proposed a calibration approach for wind turbine blades using the laser displacement sensor (PSD) combined with the point cloud registration method. First, the nine-point fitting method was used to measure the blade surface landmark points, and then the ICP method was used to calibrate the local point cloud.

How long do wind turbine blades last?

Wind turbine blades are predicted to have a lifecycle of 20-25 years (Larsen, 2009). It was estimated that about 4.3 × 10⁷ tons of wind turbine blade composite waste will be generated by 2050 (Liu and Barlow, 2017).

What are wind turbine blades made of?

Unlike other parts of wind turbines (e.g., nacelle, tower, and foundation), wind turbine blades are typically made of fiber (carbon fiber or glass fiber)-reinforced lightweight polymer composites. Because of the inhomogeneity and complicated nature of these blades, their recycling is economically challenging.

How can blade grinding and polishing process be improved without system modeling?

The method can realize smooth transition of blade grinding and polishing process without system modeling, effectively shorten the system stability time and reduce the maximum overshoot. The system response speed is accelerated, with strong stability and flexibility.

Do wind turbine blades lose material properties during chemical treatment?

In addition, during chemical treatment, fiber materials reclaimed from wind turbine blades can lose their material properties (Paulsen and Enevoldsen, 2021). Incineration is a representative thermal treatment method for treating wind turbine blades (Kalkanis et al., 2019).

What are the technical challenges in aircraft blade grinding?

(d) Weak rigidity of blade . However, achieving control over the surface quality of aircraft blade grinding poses numerous technical challenges in developing an intelligent and high-precision robotic belt grinding system.

The goal of this review paper is to evaluate the various approaches for end-of-life management of wind turbine blades emphasizing on fibre recovery. ... One company Zagons of Germany was working in this field ...

Autonomous Surface Grinding of Wind Turbine Blades Florian Stöckl, Marcus Strand, Silvan Müller, Marco Huber, Julian Raible, Christopher Braun, Darko Katic, Benjamin Alt, and Holger ...

This session will present a novel method that generates a six degree of freedom robotic toolpath with 3D cameras for the finishing of wind turbine blades to drive down the levelized cost and ...

Wind power blade grinding

To address the challenge of automatically and efficiently grinding wind turbine blades, this article introduces a novel trajectory planning method for mobile robotic grinding wind turbine blade ...

LM Wind Power manufactured two wind turbine blades using Arkema's Elium[®] resin and Owens Corning's Ultrablade[®] fabrics. SUEZ managed cutting and grinding for ...

In order to effectively predict the surface grinding temperature of robot grinding wind turbine blade, the curved surface grinding heat source model was established according ...
