

Wind turbine blade wind rope

Does rope robotics repair wind turbine blades?

Rope Robotics' "BR-8" robot can restore up to 3% energy output within less than one day per blade at half the cost of manual solutions. First on the market, Rope Robotics' nine robots have been in commercial operation for 18 months and have repaired over 150 wind turbine blades in the United States, Canada, South Africa and Europe.

Can a robot repair a rain-damaged wind turbine blade?

AARHUS, Denmark, 6 February, 2023 - After over 18 months in operation, having repaired over 150 rain-damaged onshore wind turbine blades on three continents, the patented robot from Denmark's Rope Robotics, the world leader in robotic blade maintenance, has demonstrated return on investment for turbine owners within just six months.

Who makes wind turbine blade repair robots?

Rope Robotics, headquartered in Aarhus, Denmark, is the world leader in robotic wind turbine blade repair and maintenance solutions. Founded in 2016, the company developed the world's first leading-edge commercial blade repair robot, which started large-scale repairs in 2021.

Do wind turbine blades need maintenance?

Regular maintenance of wind turbine blades is crucial for operating them with optimal performance," notes Padkaer. Repair works are currently carried out by specially trained rope access technicians who hang outside the wind turbine nacelle - a highly risky and expensive venture.

Does rain damage wind turbine blades?

Rain drops at that speed act like a hail of bullets that, over time, damage the leading edge of the blade," explains Martin Huus Bjerge, CEO, Rope Robotics. Efficient leading-edge repair contributes to life extension of one of the most expensive components on a wind turbine accounting for some 25 to 30% of the build cost.

How rope robotics improved wind turbine maintenance?

Rope Robotics significantly advanced the automation and user-friendliness of robots that conduct wind turbine maintenance. It also defined the complete operational set-up, including the safety and training procedures, integrated the ancillary equipment and tailored the marketing and communication activities to commercialise the technology.

After more than 18 months in operation, having repaired 150+ rain-damaged onshore wind turbine blades in the U.S., Canada, South Africa and Europe, the patented "BR-8" robot from Rope Robotics (Aarhus, Denmark), ...

Category 3 Blade Damage issues involve the blades integrity and/or performance which has been affected by

Wind turbine blade wind rope

damage. In this scenario, we document the issue and advise repairs to be completed by our Rope Access Team within 6 to 12 ...

Our delivery portfolio includes traditional rope access solutions, as well as platform access methods, allowing GEV Wind Power to provide cost effective blade repair scopes globally. GEV's experienced and highly trained wind ...

AARHUS, Denmark, 6 February, 2023 - After over 18 months in operation, having repaired over 150 rain-damaged onshore wind turbine blades on three continents, the patented robot from Denmark's Rope Robotics, the world ...

Help Craneless Wind Turbine Blade Replacement System Work Flawlessly Replacing blades on a wind turbine is not a simple task. Blades range from 40-60 meters in length and can weigh 16 ...

By leveraging the flexibility of the skills of our WindCorps™ technicians and proven technology, we provide thorough and unbiased turbine and blade inspection services. Rope Partner will either ...

Denmark-based company Rope Robotics unveiled the BR-8 robot that walks along the enormous blades of wind turbines to perform repairs and maintenance tasks. The new system reduces the necessity of rope ...
