How much does a wind turbine cost?

As of 2019, the capital cost of a wind turbine was around \$1 million per megawatt of nameplate capacity, though this figure varies by location; for example, such numbers ranged from a half million in South America to \$1.7 million in Asia.

What are the components of a wind turbine?

Wind turbine Components of a wind turbine. Modern commercial wind turbines produce electricity by using rotational energy to drive an electrical generator. They are made up of one or more blades attached to a rotor and an enclosure called a nacelle that contains a drive train atop a tall tower.

What is a wind turbine?

The term windmill, which typically refers to the conversion of wind energy into power for milling or pumping, is sometimes used to describe a wind turbine. However, the term wind turbine is widely used in mainstream references to renewable energy (see also wind power).

How does a wind turbine work?

It involves using wind turbines to convert the turning motion of blades, pushed by moving air (kinetic energy) into electrical energy (electricity). This requires certain technologies, such as a generator that sits at the top of a tower, behind the blades, in the head (nacelle) of a wind turbine. Graphic from Wind Energy Technologies Office

How many blades does a wind turbine have?

Turbines used in wind farms for commercial production of electric power are usually three-bladed. These have low torque ripple, which contributes to good reliability. The blades are usually colored white for daytime visibility by aircraft and range in length from 20 to 80 meters (66 to 262 ft). The size and height of turbines increase year by year.

Where can wind turbines be built?

Wind turbines can be built on land or offshore in large bodies of water like oceans and lakes. The U.S. Department of Energy is currently funding projects to facilitate offshore wind deployment in U.S. waters. Modern wind turbines can be categorized by where they are installed and how they are connected to the grid:

The vast majority of wind turbines seen around the county on wind farms (both on-shore and off-shore) are standard 3 blade designs. However, a number of different styles/types of turbines exist and the way in which they ...

Wind energy is one of the largest sources of clean, renewable energy in the United States, making it essential to a future carbon-free energy sector. Wind turbines do not release emissions that pollute our air or water, and
