What are the main features of solar photovoltaic (PV) generation?

Abstract: This chapter presents the important features of solar photovoltaic (PV) generation and an overview of electrical storage technologies. The basic unit of a solar PV generation system is a solar cell, which is a P-N junction diode. The power electronic converters used in solar systems are usually DC-DC converters and DC-AC converters.

What are the different types of silicon solar cells?

When it comes to silicon solar cells, there are generally two different types: monocrystalline and polycrystalline. Monocrystalline cells include a single silicon crystal, while polycrystalline cells contain fragments of silicon.

What is the working principle of solar cells?

All the aspects presented in this chapter will be discussed in greater detail in the following chapters. The working principle of solar cells is based on the photovoltaic effect, i.e. the generation of a potential difference at the junction of two different materials in response to electromagnetic radiation.

Why are solar cells made out of silicon?

Crystalline silicon cells are made of silicon atoms connected to one another to form a crystal lattice. This lattice provides an organized structure that makes conversion of light into electricity more efficient. Solar cells made out of silicon currently provide a combination of high efficiency, low cost, and long lifetime.

Why is silicon a good material for solar cells?

Silicon has a bandgap of approximately 1.12 eV, which is one of the reasons that makes it an excellent material for solar cells (Box 3.1). Why do we use silicon solar cells?

What is the operating principle of a solar cell?

Conceptually, the operating principle of a solar cell can be summarized as follows. Sunlight is absorbed in a material in which electrons can have two energy levels, one low and one high. When light is absorbed, electrons transit from the low-energy level to the high-energy level.
